

HMDS Diktat

HMDS Diktat Powered by ViPNet

Fast and Secure Workflow in Medical Practice

HMDS Diktat facilitates common dictation work with modern equipment as well as with secure and fully-automated transmission technology. This solution enables a quick and secure processing of admission notes even if healthcare institutions are geographically distributed. HMDS Diktat creates a userfriendly environment for outsourcing administrative tasks to a typing pool or to a small company / home office.

The main idea of the solution is to utilize this workflow in medical practice.

The expenses on preparing the necessary medical documents are reduced to a minimum. In addition, administrative tasks automation raises the productivity.

For the secure and encrypted exchange of sensitive data, the ViPNet encryption technology by Infotecs is implemented. ViPNet stands out as a hardware- and software-based, easily scalable solution, which protects data transmission both within a LAN and in the Internet.

Smooth Transmission of Encrypted Data

A doctor speaks patient related information to the voice recorder; digital audio data are automatically collected and encrypted, and then transferred to a secretary or a typing pool over a protected channel.

Upon arrival, this audio file is transformed by a typist into a text file and then automatically

transmitted in the encrypted form via the Internet back to the doctor for verification and signing.

The HMDS Diktat solution meets the needs of both individual medical consultants and healthcare institutions with a central typing pool. In the pool, the dictated files are transmitted to a distribution point, which then forwards them to the secretary.
